

SeleniumFlex API Setup

The SeleniumFlex API is included in the lib directory of this Sample application

In order for it to be compiled into the application you must include it in the compiler command line arguments.

To do this in Flex Builder/Eclipse:

1. Go to you project properties i.e. right click on the project and go to properties
2. Click on the "Flex Compiler" option from the list
3. Add the following text to the "Additional compiler arguments"

```
-include-files -include-libraries "libs\SeleniumFlexAPI.swc"
```
